YASH BHAGAT

Round Rock, TX | ybhagat2011@gmail.com | papers.ssrn.com/abstract=7231838
GitHub: IB Research Terminal | GitHub: Activist Screener | Medium: Finance Author

SUMMARY

Finance researcher with published M&A event study (SSRN), investment banking simulations at JPMorgan, Bank of America, and Citi, and 3 Medium publications. Proficient in DCF valuation, LBO analysis, comparable company analysis (comps), precedent transaction analysis, equity research, and capital markets, targeting investment banking.

EDUCATION

Round Rock High School, Round Rock, TX
Expected Graduation: May 2029 | GPA: 4.0 / 4.0 (Unweighted)

Relevant Coursework: Statistics, Computer Science, Economics

RESEARCH EXPERIENCE

Independent Researcher, M&A Financing Structure and Announcement Returns *2025 to 2026*
Published Research | papers.ssrn.com/abstract=7231838

- Documented a 4.2pp cash-financing premium in mid-cap M&A announcement returns, consistent with 40 years of empirical M&A literature, by applying an OLS market-model event study to 25 hand-coded deals sourced from a 1,400-deal SEC EDGAR candidate universe, benchmarked against MDY.
- Built a production-grade Python data pipeline processing 27,000 SEC filings (proxy statements, tender offers, 8-Ks) to isolate a clean 25-deal analysis sample, achieving measurable accuracy in acquirer/target identity validation across filing types.
- Eliminated a key robustness threat by running 100,000-iteration permutation tests, winsorizing the Collegium outlier, and applying Fisher's exact test (p = 0.75) to confirm zero selection bias in excluded deals, converting a stated limitation into a verified finding.
- Published findings on OSF and translated results into 3 Medium articles, demonstrating ability to communicate M&A research findings at both academic and non-technical levels.

PUBLICATIONS

Finance Author, Medium *2026 to Present*

- Authored 3 published finance articles covering SEC EDGAR data pipelines, the signaling hypothesis in stock-financed M&A, and independent research methodology, reaching a general-audience readership with original findings from the published event study.
- Produced original data visualizations for each article using matplotlib, translating quantitative M&A findings, cumulative abnormal returns, deal-level returns, and permutation distributions, into graphics for non-technical readers.

EXPERIENCE

Investment Banking Job Simulation, JPMorganChase (Forage) *July 2026*

- Produced a client-ready M&A advisory pitch book, including acquisition target screening, DCF valuation model, and sensitivity analysis across a competing bid and supply chain disruption scenarios, replicating the bulge-bracket analyst deliverable workflow.

Investment Banking Job Simulation, Bank of America (Forage) *July 2026*

- Built a full DCF model and comparable company analysis (comps) to produce an implied equity value and per-share valuation for an acquisition target, including a sensitivity table across WACC and terminal growth rate assumptions.

Investment Banking Job Simulation, Citi (Forage) *July 2026*

- Delivered a buyside M&A advisory package, company profile, five-year income statement projection, and precedent transaction analysis, acting as a buyside analyst evaluating a small-cap acquisition target.

PROJECTS

Activist Vulnerability Screener, Python and Reverse DCF (github.com/yashvijaybhagat-lab/activist-screener) 2026

- Screened 26 mid-cap SaaS companies for activist vulnerability via a reverse DCF engine that back-solves market-implied revenue CAGR vs. 3-year SEC-sourced historical CAGR, flagging POWI at a 61pp gap and TENB at a 38pp gap; published advisory tearsheets on GitHub.

IB Research Terminal, Bloomberg-Style Chrome Extension (github.com/yashvijaybhagat-lab/ib-research-terminal) 2026

- Built an open-source Chrome extension replicating Bloomberg Terminal workflows, including M&A precedent transaction research, live equity pricing, and DCF/WACC modeling, sourcing data from SEC EDGAR and Yahoo Finance.

SKILLS

Finance: DCF valuation, LBO analysis, M&A advisory, comparable company analysis (comps), precedent transaction analysis, equity research, capital markets, WACC, sensitivity analysis, financial modeling

Technical: Python (pandas, matplotlib, scipy, web scraping), Excel, SEC EDGAR, Bloomberg Terminal workflows, OLS market model, event study methodology, permutation testing

Communication: Pitch book preparation, data visualization, academic writing, PowerPoint, audience communication

Certifications: Finance & Accounting, Wharton Online | Quantitative Modeling, UPenn | IB Financial Analysis, UIUC
